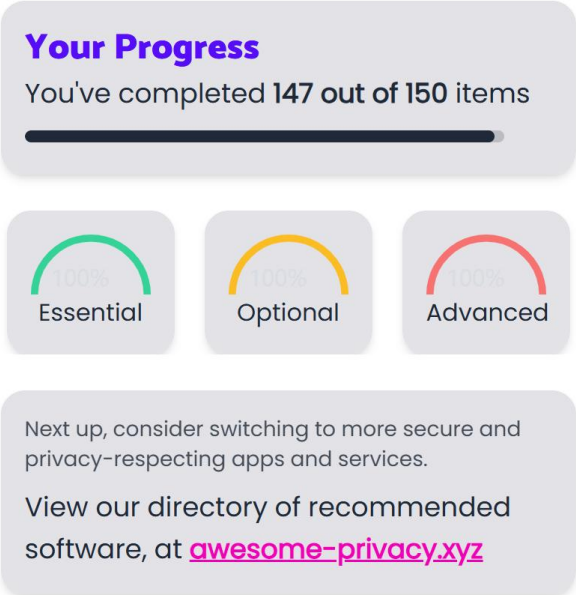
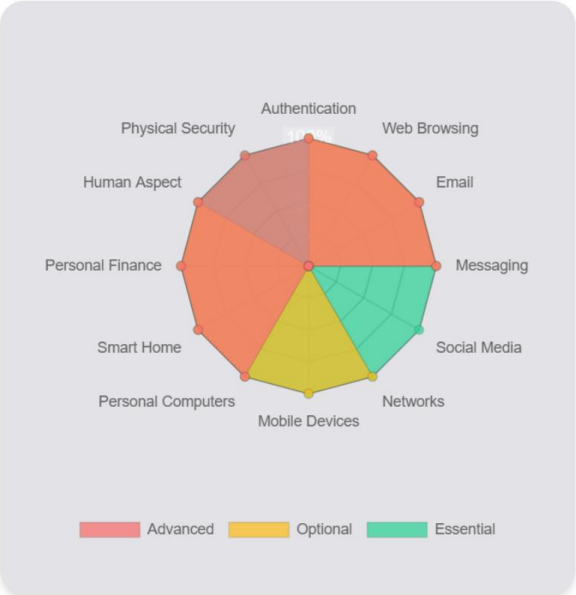
LAB 08 – Report

Analysis and self-assessment report

My result is very strong: I completed 147 out of 150 items, with 100% completion in essential, optional, and advanced categories.





Safest segments

The safest areas are authentication, web browsing, email, messaging, personal finance, physical security, smart home security, and human awareness. These areas protect against common risks such as phishing, weak passwords, unsafe links, and social engineering.

Biggest shortcomings

The main weaknesses are social media, networks, and mobile devices. These areas are highly exposed because they can reveal personal data, allow tracking, or become entry points for attacks.

What surprised me

I was surprised that even with a high score, some risks remain. Good technical settings do not remove risks from public information, daily habits, or social media exposure.

What I will change

I will review social media privacy settings, reduce public personal information, check mobile app permissions, keep updates enabled, and be more careful on public Wi-Fi. I will also continue using strong passwords, MFA, and careful email verification.

Reflection

How important is awareness of digital exposure?

Awareness of digital exposure is very important because many risks come from information, we share ourselves. Attackers can use public information for phishing, identity theft, social engineering, or guessing passwords and security questions.

Would I recommend this tool to others?

Yes, I would recommend this tool to parents, friends, and colleagues. It is useful because it explains digital security in a simple way and helps people identify weak points in their daily habits.

How would I adapt this checklist for school or business?

For a **school**, I would make the checklist simpler and focus on passwords, social media safety, cyberbullying, phishing, and safe browsing.

For a **business**, I would add topics such as company email security, secure file sharing, device encryption, VPN use, phishing training, access control, and reporting suspicious messages.
